

Sales KPI reporting and quality review

Business question. Can a manager rely on the dashboard to compare actual sales with plan and explain growth? This note reviews the project's demonstration-data dashboard before its figures are used in a management report.

AZN 1.139bn Displayed sales	AZN 1.139bn Displayed plan	100.02% Recomputed attainment
---------------------------------------	--------------------------------------	---

What the displayed numbers support

The dashboard table shows sales of **AZN 1,139,018,897.82** against a plan of **AZN 1,138,801,131.82**. The arithmetic gives a variance of **+AZN 217,766.00** and attainment of **100.02%**. This verifies the total-row percentage from the displayed figures, not the source data.

A prior-year sales card shows **AZN 728.63m**; comparing it with current displayed sales implies approximately **56.3% growth** only if both figures cover comparable periods and definitions. The dashboard also shows 278 buyers, but the buyer-count definition is not documented in the public repository.

Quality checks before management use

Observation	Why it matters / action
The same AZN 1.1388bn plan appears beside individual months in the visible table; March's 10.75% uses that denominator.	A monthly rate must use a monthly plan, or be labelled as contribution to annual plan. Check plan grain, date relationships and DAX filter context.
'Previous month sales' repeats the total-sales card, while 'previous month sales %' reads 0.00.	These measures may have a date-filter problem. Test with a single month selected and a known prior month before publishing a trend claim.
Growth is shown as 0.56, without a unit or period definition.	Format as a percentage if intended to mean ~56%, and document the comparison period and treatment of partial years.

Recommended next step

Treat the overall sales-versus-plan result as **provisional**. Validate monthly plan allocation, prior-period measures and the buyer definition; then publish a one-page executive summary with a metric dictionary, trend explanation and action owner. This is a data-governance checkpoint, not a claim that the underlying business improved.
